

Dear Hiring Manager,

I am excited to apply for the Chief Architect position at Fugro. With more than 20 years of experience defining enterprise technology strategy and leading large-scale technology transformation for global organizations such as Goldman Sachs and adidas, I am motivated by the opportunity to help shape Fugro's technology vision and enable the next generation of digital, data, and AI-driven capabilities.

Throughout my career, I have partnered with executive leadership to translate business strategy into enterprise technology strategy, architecture governance, and modernization roadmaps. I have led cloud transformation initiatives, established enterprise architecture practices, introduced data strategy through Data Mesh and federated governance, driven AI adoption, and built high-performing international architecture teams. Whether defining enterprise technology standards, guiding strategic technology investments, or mentoring architects, my focus has always been on creating technology organizations that are secure, scalable, resilient, and aligned with business objectives.

One aspect of my background that I believe is particularly relevant to Fugro is my ability to succeed in industries that were initially new to me. When I joined adidas, I had no prior eCommerce experience. Within a few years, I helped define the technology strategy and enterprise architecture that supported the company's global digital expansion, enabling growth from a \$50 million business to more than \$2 billion in annual online revenue across more than 40 countries. Likewise, when I joined Goldman Sachs, I had no previous experience in investment management. By quickly understanding the business domain and building trusted relationships with business and engineering leaders, I became the Principal Enterprise Architect responsible for enterprise-wide modernization initiatives, cloud strategy, data architecture, and AI-enabled engineering transformation.

For that reason, I see my limited experience in geospatial technology not as a barrier, but as another opportunity to apply the same approach that has been successful throughout my career: learn the business deeply, partner closely with domain experts, and combine strong technology leadership with pragmatic architecture to deliver meaningful business outcomes.

What attracts me most to Fugro is the opportunity to shape technology strategy in an organization where data, digital platforms, and AI are fundamental to delivering insights about the world's physical environment. I am excited by the challenge of helping evolve the technology landscape that enables Fugro's geospatial and data-driven services while establishing architecture standards, mentoring architects, and ensuring technology investments align with long-term business objectives.

I would welcome the opportunity to discuss how my experience in enterprise technology leadership, architecture strategy, and large-scale transformation can help Fugro evolve its technology landscape and support its long-term business ambitions.

Kind regards,
Serkan Karaarslan
